

PATENT CLUSTERS:

From Basic Research to Commercial Products

CSET's data science team has developed a cutting-edge way to map our dataset of **130+ million global patents** into clusters. Patent clusters are a window into the worldwide research-to-innovation pipeline and provide vital information on key technology areas.

About Patents

What is a patent?

Inventors file patents through a legal process to protect a design or a product, staking a claim on a recent development or a new method. Tracking patents is therefore a window into the innovation space.

Commercialization

What can patents tell us?

A next step after basic research is patenting. Tracking patents provides quantitative information about the commercialization process.

**130+
Million**

Patents within
CSET's patent
database.

Patents are a key
window into
emerging
technology
innovation.

**100K+
Patent Clusters**

We generate key insights on technology areas,
top inventors, patent owners, classification
codes, and keywords.

**Multiple
Patent
Features**

Patent Citations: Citing related patents.
CPC Codes: Labels linking similar patents.
Title & Abstract: Text analysis of key patent info.

Visualizing the Innovation Landscape

CSET's Map of Patents

Leverages a novel methodology to create a set of patent clusters. This methodology incorporates features of patent data in order to address key challenges that are present when working with global patent data. With this set of patent clusters, one can more easily investigate the status of innovation in technology areas, as well as identify the top entities that invent or own the innovation.

Stay tuned for our Map of Patents interactive tool in the coming months!
